PROJECT INTRODUCTION

This platform addresses the disconnect between job seekers and employers by offering a unified solution with searchable profiles and reliable notifications. It enables job seekers to find and apply for relevant roles, while employers can post jobs and review vetted applicants all within one streamlined system.

TECHNOLOGY STACK

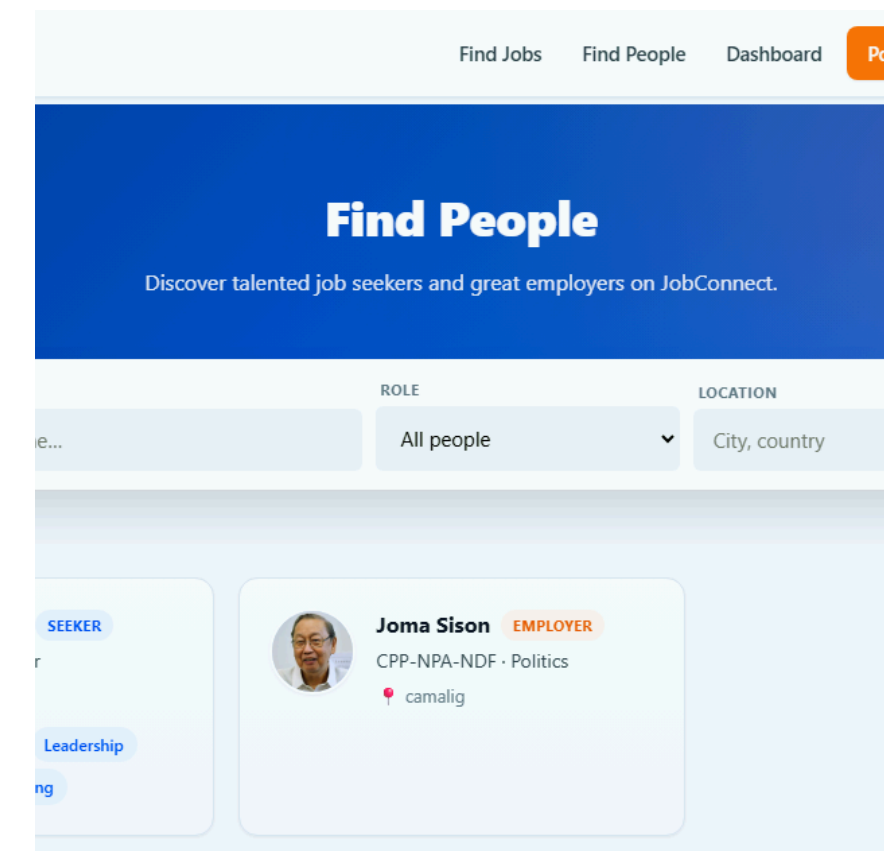

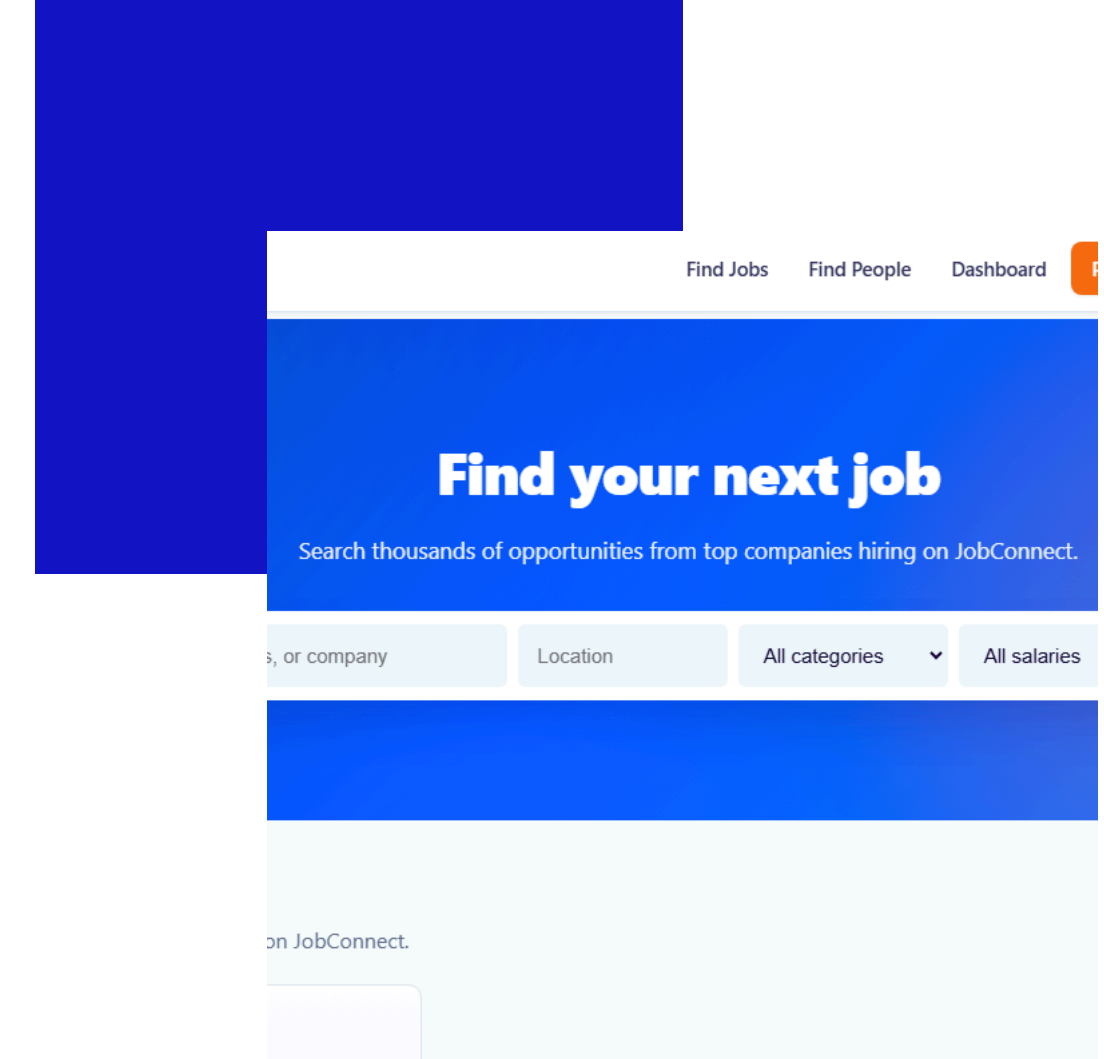

- **Node.js + Express** — backend server and routing.
- **EJS** — server-rendered HTML templates.
- **MongoDB + Mongoose** — database for users, jobs, and applications.
- **Passport.js** — authentication (local + Google OAuth).
- **Nodemailer (Gmail SMTP)** — application email notifications.

FEATURES

- Authentication
- Job posting (employers)
- Job search (seekers)
- Profile pages + profile search.
- Apply to jobs with cover letter and resume link.
- Email notifications

LIVE DEMO

CHALLENGES ENCOUNTERED

- **Google OAuth users had no password** — solved with a dedicated set-password flow.
- **Salary input as free text caused inconsistent data** — solved with a non-typeable dual-range slider.
- **Sending emails reliably from Gmail** — solved with Nodemailer + App Password.
- **Keeping the UI consistent across many pages** — solved with shared layout

FUTURE IMPROVEMENTS

- In-app notifications and chat between seeker and employer.
- AI-powered job recommendations based on profile.
- Resume upload + parsing (instead of just a link).
- Employer dashboard with applicant tracking.
- Mobile app version.
